

Retail & E-commerce Performance Intelligence

A four-page decision intelligence dashboard connecting executive performance, product, customer, geography and order-health analysis.

Executive summary

Retail teams often manage sales, product, customer, geographic, fulfilment and return information in separate reports. This demonstration consolidates those signals into one decision-focused analytical experience for leadership and operating teams.

₹16.85M	₹8.15M	6,000	5.68%
Net sales	Total profit	Orders	Return rate

The challenge

Fragmented reporting makes it difficult to see whether headline revenue performance is supported by healthy product mix, repeat customers, regional profitability and reliable order fulfilment.

Teams lose time reconciling reports, interpreting inconsistent KPIs and moving between disconnected views before they can investigate an issue.

The solution

RUSA Analytics designed a four-page Power BI demonstration that moves from enterprise-level performance to functional investigation. The experience combines summary KPIs, trend views, product comparisons, customer segmentation, geographic analysis and order-health monitoring.

The design emphasises clear navigation, consistent filters and decision-ready visual hierarchy.

Demonstration disclosure

All figures shown are generated from synthetic portfolio data. They do not represent a live client deployment, verified savings, revenue uplift or operational improvement.

What the dashboard enables

- Monitor net sales, profit, orders and returns in one view.
- Compare performance across time, category and region.
- Identify product, channel, device and discount patterns.
- Examine customer segments, repeat behaviour and acquisition mix.
- Review delivery, payment, order-status and return exceptions.
- Support structured weekly and monthly business reviews.

Solution architecture

The dashboard is organised as a guided analytical journey. Each page answers a different business question while retaining consistent filtering and navigation.

01	Executive Summary	How is the business performing overall?	Sales, profit, orders, returns, regional and category trends
02	Product & E-commerce	Which products and digital channels drive performance?	Product, category, channel, device and discount analysis
03	Customer Insights	Who buys, returns and repeats?	Segments, repeat behaviour, acquisition and customer value
04	Geography & Order Health	Where are operational risks emerging?	Regions, payments, delivery, status and returns

Technical approach

Data preparation

Power Query structures and cleans the source data before modelling. The demonstration assumes governed definitions for orders, returns, net sales, profit, customer status and fulfilment measures.

Analytical model

A dimensional model supports consistent filtering across dates, products, customers, channels and geography. DAX measures provide the calculation layer for KPIs and contextual comparisons.

Experience design

Four focused pages reduce clutter and let users move from summary to investigation. Slicers, interactions and drill-through are intended to preserve filter context across analysis.

Protected intellectual property

The public case study includes approved visuals and documentation. The PBIX, source dataset, semantic model, Power Query steps and detailed DAX logic remain private.

Implementation principle

A useful dashboard is not a collection of charts. It is a controlled path from signal to explanation to action.

01 | Executive Summary

A consolidated leadership view of commercial performance and the signals requiring investigation.

Purpose

Track net sales, total profit, orders, return rate, category contribution, regional performance and monthly movement in a single review view.

Decisions supported

- Identify improvement or deterioration.
- Prioritise categories and regions.
- Review whether returns weaken sales.
- Set the business-review agenda.

Primary users

Founders, executives, finance leaders, commercial heads and business-unit managers.

Recommended cadence

Weekly operating review with a monthly executive trend discussion.

Guardrail

Interpret every KPI within the active filter context.

02 | Product & E-commerce Analytics

Connect overall results with the products, categories and digital channels driving them.

Purpose

Combine product and category comparisons with channel, device and discount analysis to expose the commercial structure beneath headline performance.

Decisions supported

- Compare product and category contribution.
- Review channel and device mix.
- Detect discount patterns needing investigation.
- Focus assortment and promotion reviews.

Primary users

E-commerce, merchandising, category, sales and commercial analytics teams.

Questions answered

Which products contribute sales and profit? How does channel or device mix vary? Where do discount patterns warrant deeper review?

03 | Customer Insights

Translate customer activity into retention, acquisition and value discussions.

Purpose

Customer segmentation, repeat behaviour, acquisition mix and customer-value views create a consistent foundation for growth analysis.

Decisions supported

- Compare segment contribution.
- Review repeat versus new behaviour.
- Evaluate acquisition-channel mix.
- Identify cohorts for deeper analysis.

Primary users

Marketing, e-commerce, CRM, growth and commercial analytics teams.

Interpretation guardrail

Customer percentages require explicit definitions, correct denominators and validated date context before promotion.

04 | Geography & Order Health

Link regional performance with payment, delivery, order-status and return signals.

Geography & Order Health Analytics

Track Performance, Reduce Losses, Improve Fulfillment

Date	Region	State	City	Category	
All	All	All	All	All	<button>Reset</button>
Net Sales ₹ 16.85M	Orders 6000	Delivered Orders 5293	Returned Orders 341	Cancelled Orders 366	
0.00%	0.00%	88.22%	5.68%	6.10%	

Sales by Region

Net Sales (₹)

Sales by State

Top 10 states by net sales

Sales by City

Top 10 cities

Order Status Trend

Monthly orders

Return Rate by State

% of orders returned

Cancellation Rate by Channel

% of orders cancelled

Key Insights

Maharashtra has the highest return rate (8.4%). Review product quality and fulfillment processes

Marketplace has the highest cancellation rate (9.2%). Evaluate seller and delivery performance.

South region shows strong growth potential with 21% YoY increase in sales.

Purpose

Regional sales and profit are analysed alongside operational health to expose where commercial results and customer experience may be diverging.

Decisions supported

- Prioritise geographic exceptions.
- Review payment and delivery patterns.
- Investigate order-status bottlenecks.
- Distinguish isolated from systemic returns.

Primary users

Operations, fulfilment, regional management, customer experience and commercial leaders.

Questions answered

Where are performance gaps concentrated? Which fulfilment patterns need attention? Are returns isolated or systemic?

Business value and operating model

This demonstration does not claim realised impact. It shows how a production implementation could improve the speed, consistency and discipline of retail decision-making when connected to governed client data.

Operating need	Dashboard capability	Decision enabled
Leadership visibility	Unified executive KPIs and trends	Prioritise areas needing investigation
Product performance	Category, product, channel and discount views	Refine assortment, pricing and promotion review
Customer growth	Segments, repeat behaviour and acquisition mix	Focus retention and acquisition analysis
Regional management	Sales and profit by geography	Direct attention to underperforming markets
Order health	Delivery, status, payment and returns	Investigate service and fulfilment exceptions

Recommended production workflow

1. Align

Agree business questions, KPI definitions, owners and refresh expectations.

2. Connect

Integrate approved commerce, finance, customer and fulfilment sources.

3. Govern

Validate dimensions, calculations, access rules and lineage.

4. Design

Prototype navigation, filters, exceptions and review workflows with users.

5. Validate

Test totals, edge cases, drill-through, sorting and performance.

6. Adopt

Train users, monitor usage and improve the model as decisions evolve.

Success measure

The dashboard succeeds only when teams use the same definitions, find exceptions faster and make clearer decisions. Visual polish alone is not business value.

Project scope, limitations and next step

Demonstrated scope

- Four analytical pages
- Executive KPI monitoring
- Product and e-commerce analysis
- Customer intelligence
- Geography and order-health monitoring
- Interactive filtering and drill-through design
- Power Query, dimensional modelling and DAX

Public assets

Approved screenshots, demonstration video, documentation and static HTML presentation.

Not included publicly

- PBIX source file
- Raw or modelled dataset
- Semantic model
- Power Query transformation steps
- Detailed DAX catalogue
- Proprietary implementation logic

Limitations

Synthetic data only. No live integrations, user adoption, realised savings, revenue uplift or client deployment are claimed.

How this can be adapted

A client implementation can be tailored to actual data sources, KPI definitions, branding, reporting cadence, security requirements and operational workflows.

Build decision intelligence around your business

RUSA Analytics develops AI-powered decision intelligence across data foundations, analytics, automation, AI engineering and generative AI.
